A Brand & Generic Drug Quick Reference

200
COMMONLY PRESCRIBED U.S. MEDICATIONS

A free companion guide to
“First Try: Certified. — Pharmacy Technician Edition”

FOR CERTIFICATION CANDIDATES & WORKING TECHNICIANS
by Rudy Amiel, CPhT, RPT — RudyOnMarsStudio on Etsy

Welcome, Future Tech.

One of the most common things new certification candidates say they wish they had sooner is a simple, no-fluff way to connect a brand name to its generic — and back again. Exams (and real pharmacy counters) rarely wait for you to remember which is which.

This guide lists 200 of the most frequently prescribed medications in the United States, organized by therapeutic category, with the generic name, common brand name(s), drug class, and primary use side by side. Flip to a category to study by body system, or jump to the A–Z index in the back for a fast lookup either direction.

This is a study and workplace-reference tool — not medical advice, and not a substitute for your pharmacy's official references, drug labeling, or clinical judgment. Always verify against current, approved sources before making any patient-care decision.

*“Good technicians memorize the list.
Great technicians understand why the list matters.”*

HOW THIS GUIDE IS ORGANIZED

- 20 therapeutic categories, grouped the way you'll actually encounter them on the bench
- Generic name, brand name(s), drug class, and common use — every entry
- A brand-name suffix cheat sheet to help you recognize drug classes on sight
- A full A–Z index in the back for quick lookup, either direction

Read The Name Before You Know It.

Most generic drug names carry a suffix that hints at their drug class. Recognizing these patterns lets you make an educated guess on an unfamiliar drug — on the exam or on the bench.

SUFFIX	DRUG CLASS	EXAMPLES
	ACE inhibitors	Lisinopril, Benazepril
-sartan	ARBs (blood pressure)	Losartan, Valsartan
	Beta blockers	Metoprolol, Atenolol
-dipine	Calcium channel blockers	Amlodipine, Nifedipine
	Cholesterol (statins)	Atorvastatin, Rosuvastatin
-prazole	Proton pump inhibitors	Omeprazole, Pantoprazole
	SGLT2 inhibitors (diabetes)	Empagliflozin, Dapagliflozin
-gliptin	DPP-4 inhibitors (diabetes)	Sitagliptin
	Penicillin antibiotics	Amoxicillin
-floxacin	Fluoroquinolone antibiotics	Ciprofloxacin
	Benzodiazepines	Lorazepam, Alprazolam
-triptan	Migraine (triptans)	Sumatriptan

Note: suffix patterns are a helpful guide, not a guarantee. Always confirm class and use against verified drug information.
